QEEG Clinical Report

EEGLens

The QEEG report is provided by NPCindex Company, operating under the QEEGhome brand.

Personal Data:

Name: Parsa Malekmahmudi

Gender: Male

Age: 2010-03-21 - 15.7 Handedness: Right

Clinical Data:

Initial diagnosis: Autism

Medication: Aripiprazole-Clonidine Date of Recording: 2025-10-04 Source of Referral: Dr Hosseini

This case belongs to Dr Hosseini

EC CONTRACTOR CONTRACT

■ TMS Reponsibility

■ Pathological Assessment

■ EEG Neuromarker Values

Neuromarker	Region	Value	Assessment
APF - EO	Frontal	11.00	High
AFP - EC	Frontal	10.25	Normal
APF - EO	Occipital	11.00	High
AFP - EC	Occipital	10.25	Normal
Arousal Level - EO	-	-	Normal
Arousal Level - EC	-	-	Normal

Pathological Assessment

Main Diagnosis: Children Disorder

ADHD Subtypes

1. Same inattentive and hyperactive prevalence, may be anxious, may be highly intelligent, need sufficient sleep, and should avoid high arbohydrate inbtake. Consider clonidine

Description

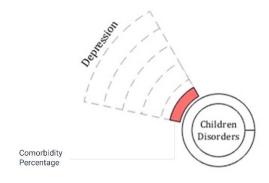

According to the guidelines, psychiatric disorders in children (under 17 years) include *ADHD*, learning disorder (LD), PTSD, OCD, depression, and anxiety.

In the above graph, the red area shows the percentage of each disorder from your patient's EEG markers. Observe that each disorder marker is not unique and can be shared with others.

User Manual

QEEG Based Predicting Medication Response

Explanation

These two tables can be considered the most important finding that can be extracted from QEEG. To prepare this list, the NPCIndex Article Review Team has studied, categorized, and extracted algorithms from many authoritative published articles on predict medication response and Pharmaco EEG studies. These articles are published between 1970 and 2021. The findings extracted from this set include 85 different factors in the raw band domains, spectrum, power, coherence, and loreta that have not been segregated to avoid complexity, and their results are shown in these diagrams. One can review details in NPCIndex.com .

Medication Recommendation

These two charts, calculate response probability to various medications, according only to QEEG indicators. Blue charts favor drug response and red charts favor drug resistance. The longer the bar, the more evidence there is in the articles. Only drugs listed in the articles are listed. These tables present the indicators reviewed in the QEEG studies and are not a substitute for physician selection.

rTMS Response Prediction

Network Performance

Accuracy: 92.10% Sensitivity: 89.13% Specificity: 97.47%

Data Distribution

About Predicting rTMS Response

This index was obtained based on machine learning approaches and by examining the QEEG biomarkers of more than 470 cases treated with rTMS. The cases were diagnosed with depression (with and without comorbidity) and all were medication free. By examining more than 40 biomarkers capable of predicting response to rTMS treatment in previous studies and with data analysis, finally 10 biomarkers including bispectral and nonlinear features entered the machine learning process. The final chart can distinguish between RTMS responsive and resistant cases with 92.1% accuracy. This difference rate is much higher than the average response to treatment of 44%, in the selection of patients with clinical criteria, and is an important finding in the direction of personalized treatment for rTMS.
