

QEEG Clinical Report BrainLens V0.4

Report Description

Personal & Clinical Data

Name	Mahdi Bagheri	Date of Recording	23-Oct-2024			
Date of Birth - Age	20-Mar-1980 - 44.59	Gender	Male			
Handedness(R/L)	Right	Source of Referral	Dr Ghomi			
Initial Diagnosis		Depression				
Current Medication	Amitriptyline					

Dr Ghomi

Denoising Information (EC)

Number of Eye and Muscle Elements				Low Artifact Percentage				
Eye	0	Muscle	4	0				
Total Artifact Percentage				High Artifact Percentage				
EEG Quali	ity	bad		Total Recording Time Remaining 3	37.35 sec			

Pathological assessment for mood disorders

Depression Probability									

EEG Compatibility with Anxiety Diagnosis

EEG Compatibility with Mood Swings Diagnosis *

Mo	ood Swings Table	EC									
	Feature Name	Threshold Region									
D	ecreased rAlpha	-0.50	50 LF-RF-MF-LT-RT-C-								
Increa	ased (rDelta+rTheta)	1.00	LF-RF-MF-C-								
li	ncreased rBeta	1.00	LT-RT-O-								
Decrea	ased Alpha Coherence	-0.50	Decreased Alpha Coherence								
Right FAA		0.00		NAN							
	BMD - 10	1 20	30	40 Mood S	50 Swing Compa	60 atibility	T 70	80	90	100	
Mood Swings Probability											

* This index can only be investigated if there are symptoms of mood swings (R/O BMD or R/O mood swings).

Cognitive Functions

Arousal Level Detection

•QEEG based predicting medication response

Effect Size

Explanation

Medication Recommendation

These two tables can be considered the most important finding that can be extracted from QEEG. To prepare this list, the NPCIndex Article Review Team has studied, categorized, and extracted algorithms from many authoritative published articles on predict medication response and Pharmaco EEG studies. These articles are published between 1970 and 2021. The findings extracted from this set include 85 different factors in the raw band domains, spectrum, power, coherence, and loreta that have not been segregated to avoid complexity, and their results are shown in these diagrams. One can review details in NPCIndex.com.

These two charts, calculate response probability to various medications, according only to QEEG indicators. Blue charts favor drug response and red charts favor drug resistance. The longer the bar, the more evidence there is in the articles. Only drugs listed in the articles are listed. These tables present the indicators reviewed in the QEEG studies and are not a substitute for physician selection.

rTMS Response Prediction

Network Performance

Accuracy: 92.1% Sensitivity: 89.13% Specificity: 97.47%

About Predicting rTMS Response

This index was obtained based on machine learning approaches and by examining the QEEG biomarkers of more than 470 cases treated with rTMS. The cases were diagnosed with depression (with and without comorbidity) and all were medication free. By examining more than 40 biomarkers capable of predicting response to rTMS treatment in previous studies and with data analysis, finally 10 biomarkers including bispectral and nonlinear features entered the machine learning process. The final chart can distinguish between RTMS responsive and resistant cases with 92.1% accuracy. This difference rate is much higher than the average response to treatment of 44%, in the selection of patients with clinical criteria, and is an important finding in the direction of personalized treatment for rTMS.

Alpha Asymmetry(AA)

APF(EC)

Frontal APF= 10.33

Posterior APF= 09.62

Absolute Power-Eye Closed (EC) 🌮

Relative Power-Eye Closed (EC) 🌮
