QEEG Clinical Report

BrainLens V0.4

Report Description

Personal & Clinical Data

Name	Hosna Navabi	Date of Recording	04-Oct-2024
Date of Birth - Age	05-Jul-1997 - 27.24	Gender	Female
Handedness(R/L)	Right	Source of Referral	Dr Dehghani
Initial Diagnosis	Rumination,Sleep Problems		
Current Medication	Medication Free		

Dr Dehghani

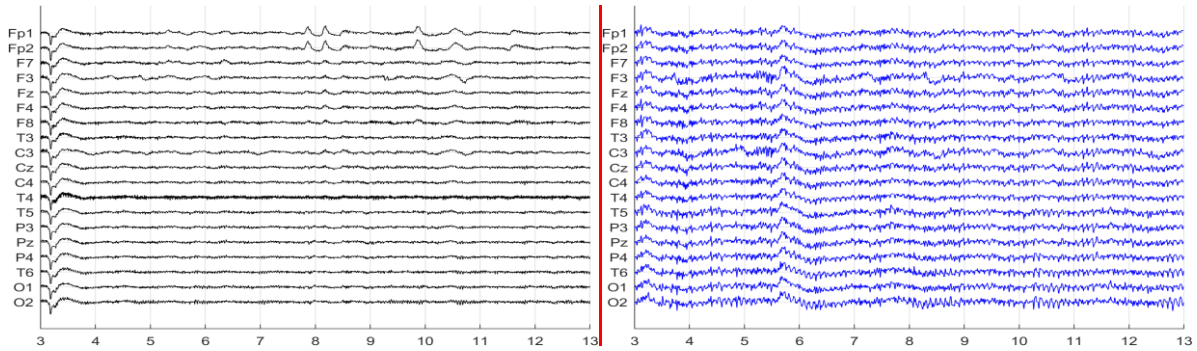
Denoising Information (EC)

Raw EEG **Denoised EEG**

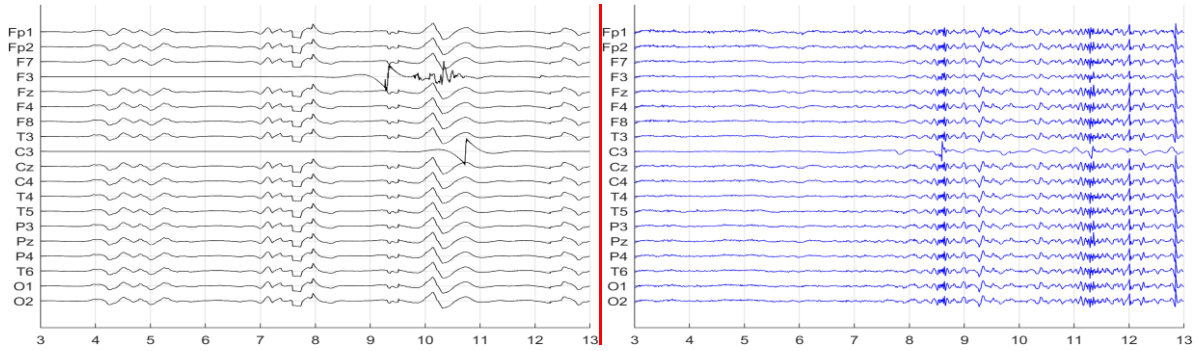


Flat Channels **Rejected Channels**

Number of Eye and Muscle Elements				Low Artifact Percentage
Eye	2	Muscle	4	
Total Artifact Percentage				High Artifact Percentage
EEG Quality	good			Total Recording Time Remaining: 211.78 sec

Denoising Information (EO)

Raw EEG **Denoised EEG**



Flat Channels **Rejected Channels**

Number of Eye and Muscle Elements				Low Artifact Percentage
Eye	2	Muscle	2	
Total Artifact Percentage				High Artifact Percentage
EEG Quality	good			Total Recording Time Remaining: 266.22 sec

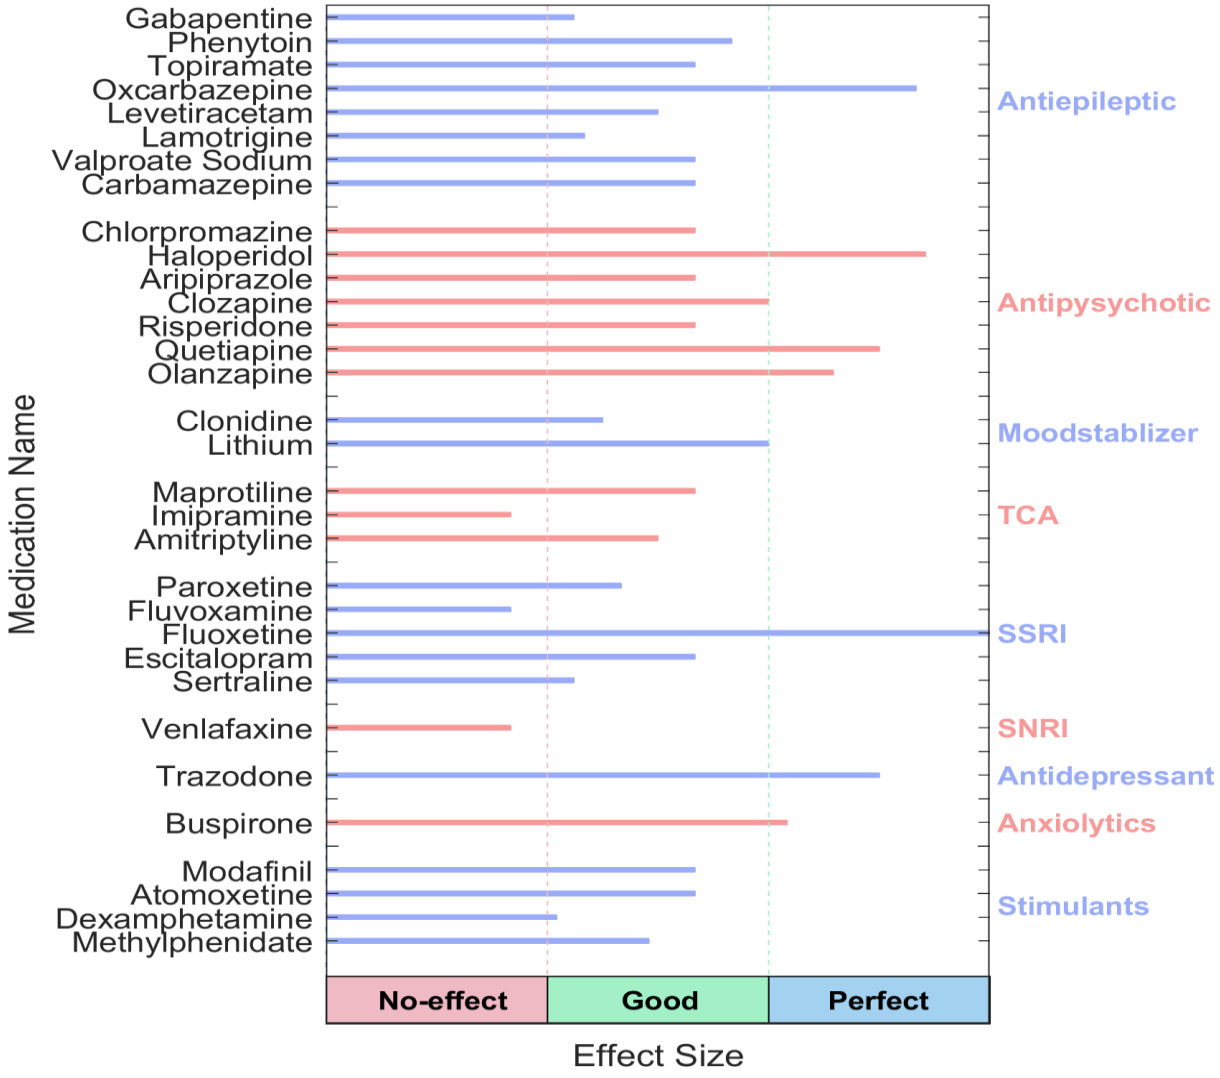
QEEG based predicting medication response



Explanation

These two tables can be considered the most important finding that can be extracted from QEEG. To prepare this list, the NPCIndex Article Review Team has studied, categorized, and extracted algorithms from many authoritative published articles on predict medication response and Pharmaco EEG studies. These articles are published between 1970 and 2021. The findings extracted from this set include 85 different factors in the raw band domains, spectrum, power, coherence, and loreta that have not been segregated to avoid complexity, and their results are shown in these diagrams. One can review details in NPCIndex.com .

Medication Recommendation

These two charts, calculate response probability to various medications, according only to QEEG indicators. Blue charts favor drug response and red charts favor drug resistance. The longer the bar, the more evidence there is in the articles. Only drugs listed in the articles are listed. These tables present the indicators reviewed in the QEEG studies and are not a substitute for physician selection.

About Predicting rTMS Response

This index was obtained based on machine learning approaches and by examining the QEEG biomarkers of more than 470 cases treated with rTMS. The cases were diagnosed with depression (with and without comorbidity) and all were medication free. By examining more than 40 biomarkers capable of predicting response to rTMS treatment in previous studies and with data analysis, finally 10 biomarkers including bispectral and nonlinear features entered the machine learning process. The final chart can distinguish between RTMS responsive and resistant cases with 92.1% accuracy. This difference rate is much higher than the average response to treatment of 44%, in the selection of patients with clinical criteria, and is an important finding in the direction of personalized treatment for rTMS.
